Better Handling of Range Helps Forage
Grazing Plans Aid to Natural Reseeding

More than 73,244,000 acres of grazing lands are being conserved, developed and utilized under range management plans which are a part of the nation's agricultural conservation program.

Better forage for livestock is a natural result of better handling of range. At the same time, the soil on the range and on nearby cropland receives increased fertility.

Proper utilization of rangeland requires a carefully worked-out "use plan" involving a number of factors. In widest use are such practices as rotating grazing, natural reseeding through deferred grazing, artificial reseeding by drilling, broadcasting and harrowing in suitable locations, development of proper spaced, adequate and dependable water supplies, eradication of destructive plants, proper fire management, uniform distribution of stock, and water spreading measures to divert runoff water and prevent erosion action.

Proper management of one range may require only a few of these practices, while another will need many or all of them in order to return the range soil to its original fertility. Reseeding, both natural and artificial, is an essential to most rangeland.

While natural reseeding through deferred grazing is held to be the most practical method, excellent results are reported from artificial reseeding on lands where sufficient remnants of desirable forage plants did not remain.

Extension Oil Can
There are usually one or two oil holes on all machinery that the average oil can will not reach. This can be remedied by taking a copper wire about three inches longer than the spout and bend at right angles, as shown in the illustration. The bent end is inserted into the oil hole and the spout is placed over the hole. The bent piece will prevent the oil from falling out but will allow the oil to follow wire into oil hole desired.

Postwar Machinery Harvester
Postwar harvesting will be taken care of by self-propelled harvesters. The self-propelled feature on this machine designed by the Minneapolis-Moline Power Implement Company, makes possible the harvest of all crops at lower cost.

Unusual engineering development makes the feature adaptable in harvesting all types of grain including rice.

Alfalfa Meal Valuable
Alfalfa meal has been found of high value as a source of the water-soluble vitamins in hog feeding. A supplement of 10 to 12 per cent alfalfa meal in a basal diet to sows in the gestation and lactation periods resulted in 82.5 per cent of their pigs reaching weaning stage. This trial showed superior results when compared with ground yellow corn, soybean meal, tankage, fish meal tankage and dried corn distillers' solubles.
